Address: 14-28 Ultimo Rd, Ultimo NSW 2007 Australia

ACADEMIC POSITIONS

2026–present	Postdoctoral Research Associate Economics Discipline Group, UTS Business School, Australia <i>ARC Discovery Project on forced migration and its effects across generations</i>
--------------	---

EDUCATION

2021–2026	PhD in Economics , University of Technology Sydney, Australia Thesis: <i>Bound by Constraints, Guided by Expectations: Essays in Economic Decision-Making</i> Principal supervisor: Adeline Delavande Co-supervisors: Elif Incekara-Hafalir and Esther Mirjam Girsberger
2017–2020	Postgraduate Degree in Economics Institute of Economics and Industrial Engineering, Russia
2016–2017	Master of Economics , Analyse et Politique Économique (M2) Paris School of Economics, France
2015–2017	Master of Economics , Quantitative Economics Novosibirsk State University, Russia
2010–2015	Bachelor of Management , Honours Novosibirsk State University, Russia

WORKING PAPERS

“Sex Ratio, Marriage Market and Assortative Matching in Colonial Tasmania”

Convict transportation left nineteenth-century Tasmania with a heavily male-biased sex ratio for decades. This setting allows a rare look at how such an imbalance shaped the marriage market, both while it persisted and long after. Combining individual marriage records with historical census data, we use the administrative allocation of convicts, conditional on labour demand, as a quasi-random source of variation in local sex ratios. The results reveal a two-stage response. In the short term, during the transportation era, male-biased sex ratios directly influenced match formation: older women were more likely to marry, and assortative matching on literacy and convict status weakened. In the longer term, over the fifty years following transportation, these distortions settled into both marriage and family formation. Marital-status sorting shifted in women’s favour, and widows were more likely to remarry in the early post-transportation years. Couples in historically more male-biased districts went on to have substantially larger families, and this effect, unlike the others, strengthened rather than faded over successive cohorts, persisting well after the imbalance itself had eased. Underlying mechanisms plausibly include better spouse quality, lower female labour supply, and more stable unions. A complementary analysis of convict registers shows that marriage under such imbalance was highly selective: men’s marriage chances depended on youth, literacy, stature, and occupational skills, whereas women’s prospects were shaped more by personal attributes such as appearance, origin, and offending history.

“The Long-Term Effects of Historical Gender Imbalances on Children’s Educational Achievement in Australia”

Can a demographic shock leave a mark on human capital more than a century after it has faded? This paper examines the long-run effect of a historically male-biased sex ratio on children’s educational achievement in Australia. The analysis exploits quasi-random variation in local sex ratios arising from the nineteenth-century convict transportation system, which allocated overwhelmingly male convicts across districts according to labour demand, creating large and uneven gender imbalances. By linking historical census data to contemporary longitudinal records on children, the analysis uses the convict sex ratio as an instrument for the total population historical sex ratio. The results show that children living in areas with more male-biased populations in the 1840s achieve significantly lower test scores in numeracy and writing today - by roughly 9 % of a standard deviation at the end of compulsory schooling. These effects are concentrated among boys, echoing the gendered nature of the original shock, and persist after accounting for detailed individual, family, school, and neighbourhood controls. Evidence on mechanisms is consistent with weaker educational incentives for men and enduring local norms surrounding gender and masculinity in historically male-biased areas.

“When Do You Expect to Be Paid? Expectations Shape Patience”

with Elif Incekara-Hafalir and Benjamin Young

Time preferences shape decisions about saving, education, and health, yet research has largely overlooked how expectations about payment timing influence elicited measures of time preferences. We provide causal evidence that such expectations systematically affect intertemporal choices. In a pre-registered experiment, we manipulate payment-timing expectations while holding choice menus fixed. Participants expecting payment in the future choose more patient options than those expecting payment today, despite identical rewards and delays. A reference-dependent model, where expected timing serves as a temporal reference point, explains these shifts. The findings illuminate patterns in the time preference literature and suggest a low-cost policy lever.

WORK IN PROGRESS

“Impact of Forced Migration on Tasmanian Convicts and Their Descendants”

with Adeline Delavande, Luis Pontes de Vasconcelos, Hamish Maxwell-Stewart and Ran Abramitzky

This project evaluates the impact of transportation on the life outcomes of convicts and their descendants by comparing transported prisoners with named brothers and sisters who remained in Britain and Ireland, so that unobserved family background and shared traits are held fixed. It then examines how punishment and place shaped outcomes within Tasmania, and traces how these effects carried across generations. The project extends existing digitisations and record linkages for the colonial period, and offers a longitudinal perspective on place-based conditions relevant to contemporary migration and settlement policy.

“Expectations and Time Preferences: A Within-Subject Design”

with Elif Incekara-Hafalir, Benjamin Young and Xueting Wang

Erakhtina et al (2026) provided causal evidence that expectations systematically affect intertemporal choices. Specifically, participants who expected payment in the future chose more patient options than participants who expected payment today, despite facing identical amounts, delays, and choice menus. We report a within-subject test of that mechanism. The payment is expected to be paid today in one part and in eight weeks in the other, with order counterbalanced. Participants make choices between money today and money in eight weeks, plus lottery choices that test whether the reference date shifts risk attitudes as well. Because the same individual is observed under both reference dates, the design allows us to examine within-person changes in choice as expected reward timing changes. We will present evidence on whether individuals’ patience changes across the two expected payment timings, as well as heterogeneity in these responses to identify who is more likely to change their intertemporal choices when expectations

about reward timing differ.

“Improving the Utility of Private Health Insurance Choice in Dual Public–Private Markets”

with Nathan Kettlewell and Hong Il Yoo

We study the quality of health insurance choices when private insurance offers a quality advantage (shorter waiting times) rather than reduced financial risk. In a controlled experiment modelled on the Australian system, we elicit willingness to pay to avoid waiting, risk preferences from incentivised lotteries, and insurance plan choices with and without decision aids. Choice quality is defined relative to welfare-maximising benchmarks that integrate monetary, risk, and waiting-time preferences. Our analysis combines two approaches. First, we estimate preferences separately for lottery and insurance tasks, allowing correlation across them. Second, we impose a coherent structural model in which utility curvature is common across tasks and waiting-time attributes act as source-dependent shifts in probability weighting. We then evaluate decision aids using both non-parametric tests (dominated choices) and structural welfare measures (consumer surplus losses relative to preference-consistent benchmarks). We find that participants often fail to incorporate waiting-time preferences into insurance choices, leading to systematic welfare losses. Decision aids improve outcomes, with effectiveness varying by tool. The results demonstrate the cognitive difficulty of integrating monetary and non-monetary attributes in insurance decisions and provide guidance for designing interventions that improve consumer choice quality.

TEACHING

2023–2026	University of Technology Sydney (teaching assistant) 26134 Business Statistics; 23941 Mathematics for Economists; 23508 Quantitative Methods in Economics and Business.
2018–2022	Novosibirsk State University (teaching assistant, lecturer) Experimental Economics; Experimental Economics: Programming in oTree; Data Analysis in R.

RESEARCH ASSISTANCE

2022–2026	University of Technology Sydney Adeline Delavande, <i>The Ambivalence about Pregnancy, Covid Ambiguity, Uncertainty Attitudes</i> ; with Peter Siminski, <i>Impact Evaluation</i> (Paul Ramsay Foundation). Elif Incekara-Hafalir, <i>A Family of Norms: Related Beliefs about Female Labor Force Participation</i> . Anne Summers, <i>Domestic Violence and Employment</i> , and more.
2017–2020	Institute of Economics and Industrial Engineering , Russia

CONFERENCE PRESENTATIONS AND SEMINARS
